

COMMUNITY BUILT INFRASTRUCTURE

BDAG Multisig.

A practical user guide to the community multisig treasury website.

Website

multisig.bdagsosorted.co.uk

This guide explains how to access the multisig, connect an authorised owner wallet, review the Treasury Dashboard, create proposals and understand the approval flow.

BUILT TOGETHER

Created by the BDAG Community, for the BDAG Community.

WE BUILD. WE DELIVER.

Community information: bdag.community

QUICK ORIENTATION

What the multisig website is for

The site provides a shared interface for a Safe multisig treasury on BlockDAG Mainnet. A transaction is proposed, reviewed and approved by the configured Safe owners before it can be executed.

01

Community Treasury

Manage shared BDAG funds through a treasury where transactions require approval from multiple authorised owners.

02

Infrastructure

Coordinate payments for community infrastructure, hosting, servers, cloud services and other operational costs.

03

Community Projects

Provide transparent multisig control for funds allocated to development, tools, events and community-led initiatives.

THE FOUR-STEP FLOW

01

Connect an owner wallet

Access to the management dashboard is checked against the Safe owners on BlockDAG.

02

Create and review a proposal

Prepare the recipient address, BDAG amount and a clear description of the payment.

03

Collect the required approvals

Each authorised owner independently signs the Safe transaction.

04

Execute on BlockDAG

Once the configured approval threshold is reached, the transaction can be submitted to the Safe for execution.

Important: A multisig does not remove the need to check payment details. Owners should independently verify the recipient, amount and purpose before signing.

STEP 1

Start at the BDAG Multisig homepage

Open multisig.bdagsosorted.co.uk. The homepage introduces the community treasury and provides the entry point to the protected multisig dashboard.

BDAGSO SORTED BLOCKDAG MAINNET - CHAIN 1404

COMMUNITY BUILT INFRASTRUCTURE
BDAG Multisig.
 A multisig treasury requires approval from multiple authorised owners before funds can be moved. BDAG Multisig provides the community with an interface for proposing, reviewing, signing and executing shared treasury transactions on BlockDAG.

 WE BUILD. WE DELIVER.

COMMUNITY TREASURY
What can BDAG Multisig be used for?
 Multisig wallets are useful wherever funds should be managed collectively instead of being controlled by a single wallet.

- 01 Community Treasury**
Manage community-held BDAG through a shared treasury where transactions require approval from multiple authorised owners.
- 02 Infrastructure**
Coordinate payments for community infrastructure, hosting, servers, cloud services and other operational costs.
- 03 Community Projects**
Provide transparent multi-sig control for funds allocated to development, tools, events and community-led initiatives.

HOW IT WORKS
Multiple approvals. One treasury.
 The wallet is controlled by its configured Safe owners. Transactions cannot be executed until the Safe's required approval threshold has been reached.

- 01 Connect an owner wallet**
Access to the management dashboard is checked against the Safe owners on BlockDAG.
- 02 Create and review a proposal**
Treasury transactions are prepared for the Safe before owner signatures are collected.
- 03 Collect the required approvals**
Each authorised owner independently signs the Safe transaction.
- 04 Execute on BlockDAG**
Once the configured threshold is reached, the transaction can be submitted to the Safe for execution.

BDAG COMMUNITY MULTISIG WE BUILD. WE DELIVER.

Use the **ACCESS MULTISIG** button to continue to the owner access screen. The **VISIT BDAG COMMUNITY** button links to the wider community website.

**STEP 2**

Connect an authorised owner wallet

The access page is the gateway to the Treasury Dashboard. Select **CONNECT WALLET** and approve the connection in your browser wallet.

**01****Use the correct wallet**

Connect an address that is configured as an owner of the Safe.

02**Check the network**

The site is designed for BlockDAG Mainnet, Chain ID 1404.

03**Approve connection only**

Connecting lets the site read the selected wallet address. Review every later signature request separately.

Security check

Never share a seed phrase or private key with the website, another owner, an administrator or anyone claiming to provide support.

STEP 3

Understand the Treasury Dashboard

After an authorised owner connects, the dashboard brings together the Safe balance, pending transaction queue, network information, Safe configuration and owner threshold.

 Treasury transactions require the configured number of Safe owners to approve them before execution.

BDAG SO SORTED · COMMUNITY BUILT BLOCKDAG INFRASTRUCTURE

BDAGSO SORTED **BDAG** **BDAG COMMUNITY**
 Developed by Vaughan Cartwright & Matt

BDAG COMMUNITY MULTISIG WE BUILD. WE DELIVER.

At a glance: check the BDAO balance, pending proposal count, Chain ID 1404, Safe address and the Owners & Threshold section before creating or approving a payment.

STEP 4

Create and sign a treasury proposal

The New Transaction panel prepares a payment proposal for the other Safe owner(s) to review. Complete each field carefully before selecting **Create & Sign Proposal**.

The screenshot shows the BDAG multisig interface. At the top, there are tabs: 'BDAG', 'Awaiting approvals', 'Not configured', and 'BlockDAG Mainnet'. The main content area is divided into two sections. The top section is titled 'TREASURY ACTION' and 'New Transaction'. It contains a description: 'Create a BDAG transfer proposal for the other Safe owner to review and approve.' Below this are three input fields: 'Recipient Address' (with a placeholder '0x...'), 'Amount (BDAG)' (with a placeholder '0.00'), and 'Description' (with a placeholder 'What is this payment for?'). A red button labeled 'Create & Sign Proposal' is positioned below these fields. The bottom section is titled 'APPROVAL QUEUE' and 'Pending Transactions'. It shows a count of '0' pending transactions. Below this, there is a message: 'No transactions waiting' and 'New treasury proposals requiring owner signatures will appear here.' On the right side, there is a 'SAFE DETAILS' section with a 'Configuration' tab. It lists 'Network', 'Chain ID', 'Safe', and 'Pending'. Below this is a 'Multisig Security' section with a warning icon and text: 'Treasury transactions require the con to approve them before execution.'

01

Recipient Address

Paste the intended BlockDAG address and verify it independently. A wrong address can result in irreversible loss.

02

Amount (BDAG)

Enter the exact BDAG amount to be proposed.

03

Description

Use a clear purpose so other owners can understand what they are being asked to approve.

04

Create & Sign Proposal

Review the wallet signature request. Only sign when the recipient, amount and purpose match the intended payment.

STEP 5

Approvals, threshold and execution

Pending proposals appear in the Approval Queue. The Safe's configured threshold determines how many owner approvals are required before execution.

The example shown in the supplied dashboard is configured as **2 of 2**: both owners must approve. A proposal should only be executed after the required signatures have been collected.

01

Review before signing

Check the recipient, amount, description and proposal details.

02

Collect owner approvals

Each authorised owner signs independently using their own wallet.

03

Execute when threshold is reached

The final on-chain execution submits the approved Safe transaction to BlockDAG.

04

Keep a clear audit trail

Use descriptions and the transaction history/queue to make treasury activity easier for the community to review.

Remember: signing and execution are different actions. Treat every wallet prompt as a separate security decision.

OWNER CHECKLIST

Before you approve any transaction

1	Correct site	Confirm you are using multisig.bdagsosorted.co.uk.
2	Correct network	BlockDAG Mainnet - Chain ID 1404.
3	Correct Safe	Confirm the Safe address shown on the dashboard is the expected community treasury.
4	Correct recipient	Verify the destination address independently; do not rely on a pasted address alone.
5	Correct amount	Check the BDAG amount carefully, including decimal places.
6	Clear purpose	Make sure the description matches an agreed community expense or proposal.
7	Expected signature	Only approve a wallet prompt that matches the action you intended to take.
8	No secret sharing	Never reveal a seed phrase or private key.

WE BUILD. WE DELIVER.

This guide is an operational aid for using the community multisig interface. It is not financial advice. Blockchain transactions can be irreversible, so owners should independently verify transaction details before signing or executing.
